CYBERRANK

01 · OVERVIEW AND PRIORITIES

Executive overview

Partial coverage

Gmail (gmail.com) holds an IISRI external rating of CC (Medium risk band), with a net score of 86 of 360 on the 15 Oct 2026 assessment.

Grade, risk band, net score (86 / 360), aspect scores and sector benchmark are printed; score context and assessment id are not.

IISRI® External Rating

CC

Very Insufficient
Medium risk band

Score context

Net score	86 points
Point pool	360 points

Not provided in the assessment data: score context, methodology version.

Almost all information security and/or privacy controls are unlikely to provide reasonable assurance that security and/or privacy risks are being managed and objectives are met. Major work on information security and/or privacy is highly recommended.

Wording as printed in the source; it differs from the CC definition in Appendix B and is held for review.

Meaning of every grade: Appendix B IISRI rating scale, page 44

Scope and coverage

Organisation	Gmail
Primary domain	gmail.com
Sector	Telecommunications
Assessment date	15 Oct 2026

Coverage	Not available (cannot be calculated: the number of eligible targets is not available)

Not provided in the assessment data: organisation ID, assessment ID, eligible targets.

Observed targets

54 subdomains
Scanned subdomains

55 hosts
Hosts observed for residency

No additional subdomains or externally exposed assets were identified during this assessment.

This report is generated by IISRI® CyberRank.ai using automated, non-intrusive analysis of publicly accessible information. The assessment does not require access to internal systems and should be interpreted as an external risk signal.

Organisation profile

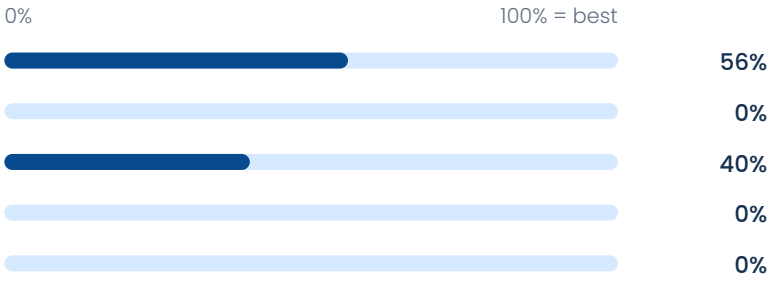

Gmail is email that's intuitive, efficient, and useful. 15 GB of storage, less spam, and mobile access. jij

Review flag RF-G01: Organisation description ends with a stray token ("access. jij"); kept verbatim.

Rating overview

All 13 aspects in report order. Five have their own score (100% = best); the rest are judged by their result.

Aspect scores

Only these five aspects have their own score. The other eight have no separate score and are judged by their result below.

All aspects

Reading order: down the left column, then the right.

03	**Privacy** **13** active privacy issues	Findings	10	**AI risk and governance** No result	Unavailable
04	**Vulnerabilities** **15** finding types · 1 High, 6 Medium, 8 Low	Findings	11	**Quantum security** **30** high-risk findings	Findings
05	**Credential exposure** **5,395** exposed account records	Findings	12	**Security resourcing** **2 of 2** privacy and security roles with public evidence	Findings

Rows 13–15 of 15

#	Priority	Action	Effort	Team
13		**Security** Described in 03 Privacy, page 8 (Issue 13).	2 weeks	Legal + DPO team
14		**Reset Compromised Credentials** Source: "Force password reset for 15879 affected accounts. Enable multi-factor authentication (MFA) for all users." Note: Verify and reset the accounts behind 3,154 rows on gmail.com that list a password category. The source counts accounts; the register lists rows, not unique accounts. Why it matters: Leaked credentials could allow unauthorized access to your systems. Verify first: 15,879 is the source headline (unit not defined); 5,395 register rows listed; unique accounts: Not available (cannot be derived from the available data). See 05 Credential exposure, page 22	1 week	IT Security team
15		**Enhance DMARC Policy to "Quarantine"** Upgrade DMARC policy from monitoring (p=none) to quarantine (p=quarantine) to actively protect against email spoofing. Why it matters: Prevents attackers from impersonating your domain in phishing attacks. Verify first: DMARC policy is not available (left blank in the assessment data). See 04 Vulnerabilities, page 11	1 week	Email admin

For every action: owner not assigned, due not assigned, status not tracked by the assessment. Rank is source order, not a stable id. Estimated time is not a due date; required role is not an owner.

Projected rating after remediation

Current rating	CC · score 86 / 360
Projected rating	A · score 280 / 360
Recoverable	194 points
Active issues	224 (13 privacy + 211 vulnerability)
Exposed credentials	15,879 (counted separately; not part of the active issues)

224 active issues were identified (13 privacy issues, 211 vulnerability findings, 15879 exposed credentials). Completing the recommended actions is expected to recover up to 194 points, moving the score from 86 to 280 out of 360. This assumes every vulnerability finding is fixed and confirmed by a fresh scan, the reported privacy issues are remediated in the privacy policy and every exposed credential is reset. Vulnerability fixes only affect the rating after the next scan, so the projected score is conditional on that rescan.

Projection as reported by the source, not a commitment. Vulnerability fixes count only after a fresh scan confirms them.

Review flag RF-G04: Remediation counts 211 vulnerability findings; the finding cards hold 183 finding-asset memberships and the active scan 7 informational findings. 224 active issues = 13 + 211 excludes the 15879 credentials named in the same sentence.

03 · ASSESSMENT DETAILS

Privacy

Evaluates privacy posture through publicly available data, privacy policies, technical implementations, and compliance with global standards including GDPR and PPDL.

Findings	One privacy policy was assessed at 56% with 13 active issues.

Findings	Published privacy policy: state, source, assessed areas and issues
Policy state	Valid policy, assessed (source p. 2: "Privacy policy exists but has 13 active risks requiring attention")
Policy source	Not available[1]
Per-area results (A–P)	Not available[1]

[1] Not provided in the assessment data.

Active issues

Issue	Type	What was found
Issue 1	Privacy	Broad data collection tied to your identity when signed in. Once you log into a Google Account, most of what you do across Search, YouTube, Gmail, Maps, and other services gets stored with your personal profile — searches, videos watched, purchase activity, communications, and even uploaded media. This makes it hard to use Google services without accumulating a detailed history linked to you.
Issue 2	Privacy	Tracking even when signed out. Google says it collects and stores data using unique identifiers tied to your browser, app, or device even when you're not signed in. So not having an account doesn't necessarily mean you're anonymous — your activity can still be profiled and linked to your device.
Issue 3	Privacy	Incognito mode doesn't fully shield you. The policy explicitly notes that third-party sites and apps using Google services (ads, analytics, embedded content) still share information with Google even when you're in Chrome Incognito mode. Users expecting full privacy in private browsing may be surprised.

Active issues · continued

Rows 4–10 of 13

Issue	Type	What was found
Issue 4	Privacy	Persistent cross-device and cross-service tracking. Google may use data collected across services and devices — and if you use third-party sites with Google ads or analytics, that activity may be associated with your personal information. This can be hard to mentally model or fully control.
Issue 5	Privacy	Location data can be inferred in multiple ways. Even if one location setting is off, Google may use IP address, sensor data, Wi-Fi access points, cell towers, and nearby Bluetooth devices to determine location. This makes it hard to truly opt out of location inference.
Issue 6	Security	Automated analysis of your content. Google uses automated systems to analyze your content for personalization, spam, malware, and illegal content detection. That means your emails, documents, and photos may be scanned by algorithms, even if humans aren't reading them.
Issue 7	Privacy	Data sharing with domain administrators. If you use Google services through work or school, your administrator and resellers may access, retain, or even delete your data and restrict your privacy controls. You may have little say over this.
Issue 8	Privacy	Data sharing for legal and business reasons. Google can share personal information in response to government requests or legal process, to enforce terms, or during a merger or acquisition. This means your data could end up with another company under a different privacy policy.
Issue 9	Privacy	Vague retention periods. The policy says some data is kept "until you delete your account," some is retained longer for "legitimate business or legal purposes," and deletion from backups may be delayed. It's hard to know exactly how long your data sticks around.
Issue 10	Privacy	Data stored and processed globally. Your information may be processed on servers outside your country, where data protection laws might be weaker. Google says it applies the same protections everywhere, but oversight and enforcement may vary by jurisdiction.

CYBERRANK

Active issues · continued

Rows 11–13 of 13

Issue	Type	What was found
Issue 11	Security	`Changes to the policy without your explicit consent (for non-right-reducing changes). Google says it won't reduce your rights without explicit consent, but other changes can be made unilaterally, with only "prominent notice" for significant ones. You may miss updates buried in notifications.`
Issue 12	Privacy	Many controls require manual effort and can be buried. While Google offers extensive privacy controls, they're spread across Privacy Checkup, My Activity, Dashboard, ad settings, and device settings. Keeping on top of all of them is a real burden for an average user.
Issue 13	Security	Public exposure through normal use. Comments, reviews, shared endorsements, and even your name and photo can appear publicly or in ads alongside your activity. If you don't actively change defaults, you may be more visible than you expect.

CYBERRANK

04 · ASSESSMENT DETAILS

Vulnerabilities

Covers external security posture including network vulnerabilities, open ports, SSL/TLS configuration, and DNS security controls protecting digital assets.

Findings	15 finding types were reported: 1 high, 6 medium and 8 low, across the apex domain and 54 scanned subdomains. The active scan of 11 hosts reported informational findings only.

0% Vulnerability score

15 finding types — Finding types

183 memberships — Finding-asset memberships

15 asset labels — Distinct affected asset labels

Review flag RF-08: Affected-asset labels mta, multisend are truncated host names (printed as is).

Review flag RF-G04: Remediation counts 211 vulnerability findings; the finding cards hold 183 finding-asset memberships and the active scan 7 informational findings. 224 active issues = 13 + 211 excludes the 15879 credentials named in the same sentence.

Scanned assets

1 domain and 54 subdomains were scanned; the apex domain is listed first.

vuln-15		LUCKY13	15	1%

Breach likelihood. Indicates the estimated probability that this vulnerability could lead to a security breach. >=30% represents high risk, 15-29% represents moderate risk, <15% represents lower risk.

Finding details

Critical 0 High 1 Medium 6 Low 8

#	Severity	Finding	Rationale and affected domains
1		cert_trust Breach likelihood 10% ID vuln-01	A HIGH severity certificate trust vulnerability (e.g., misissued, expired, or self-signed certificate in a trust chain) can enable man-in-the-middle attacks or spoofing, leading to credential theft or data interception. However, exploitation requires an attacker to be in a privileged network position (e.g., on-path) and for users or systems to interact with the malicious endpoint. Without evidence of active exploitation or a widespread, known-bad CA compromise, the likelihood is moderate but not imminent. **Affected domains (1)** alt807.m.gmail.com
2		cipherlist_3DES_IDEA Breach likelihood 5% ID vuln-02	The use of deprecated ciphers like 3DES and IDEA is a known weakness that degrades overall cryptographic security. While not an immediate, direct path to a breach, it lowers the security posture and could be leveraged as part of a broader attack chain, especially if combined with other vulnerabilities. The risk is present but not imminent without active exploitation or additional context. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend ·

Finding details · continued

Rows 2–6 of 15

#	Severity	Finding	Rationale and affected domains
		cipherlist_3DES_IDEA (cont.)	alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
3		cert_expirationStatus Breach likelihood 5% ID vuln-03	A medium-severity certificate expiration is a reliability and availability issue, not a direct confidentiality or integrity flaw. It can lead to service disruption, degraded trust, and potential man-in-the-middle opportunities if combined with other weaknesses, but does not directly cause a data breach on its own. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
4		cert_notAfter Breach likelihood 5% ID vuln-04	An expired certificate (cert_notAfter) is a medium-severity misconfiguration that disrupts service availability and trust, creating an opportunity for man-in-the-middle attacks or service impersonation. However, without evidence of active exploitation or a specific attack chain leveraging this flaw, the direct likelihood of a full breach remains low. The risk is contingent on an attacker being in a position to intercept traffic and the absence of other protective controls. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
5		BEAST_CBC_TLS1 Breach likelihood 5% ID vuln-05	BEAST is a known cryptographic attack against CBC mode in TLS 1.0 and earlier. While a MEDIUM severity finding, modern clients and servers have implemented mitigations, and TLS 1.0 is largely deprecated. Direct exploitation requires a man-in-the-middle position and specific conditions, making a full breach unlikely in a generic context without confirmed vulnerable configurations or active adversarial presence. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
6		Content-Security-Policy_multiple Breach likelihood 5% ID vuln-06	A misconfigured or missing Content-Security-Policy (CSP) is a common security weakness that increases the risk of client-side attacks like XSS. However, exploitation requires a separate, exploitable vulnerability (e.g., an XSS flaw) to be present in the application. The MEDIUM severity reflects this indirect but significant enabling role. Without evidence of an

CYBERRANK

Finding details · continued

Rows 6–10 of 15

#	Severity	Finding	Rationale and affected domains
		Content-Security-Policy_multiple (cont.)	active XSS vector, the direct breach likelihood remains low but non-zero. **Affected domains (1)** `multisend`
7		`BREACH` Breach likelihood 5% ID vuln-07	BREACH is a side-channel attack requiring specific conditions (HTTP compression, attacker-in-the-middle, repeated requests) to extract secrets from encrypted traffic. While a real vulnerability, successful exploitation is non-trivial and depends on attacker positioning and target application behavior, making a direct breach unlikely in a generic scenario. **Affected domains (1)** `multisend`
8		`TLS1` Breach likelihood 1% ID vuln-08	TLS 1.0 is a deprecated protocol with known cryptographic weaknesses (e.g., BEAST). While it increases the risk of information disclosure if an attacker is in a position to perform a man-in-the-middle attack, exploitation requires a specific, active adversary on the network path. It is not a direct, remotely exploitable vulnerability leading to system compromise. The likelihood of this single finding directly causing a breach is very low. **Affected domains (15)** `gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt218987188211145.gmail.com · alt7118113148928107 45.gmail.com · alt118.gmail.com`
9		`TLS1_1` Breach likelihood 1% ID vuln-09	TLS 1.1 is a deprecated protocol with known cryptographic weaknesses, but exploitation requires a man-in-the-middle position and is not directly actionable for initial access. Modern clients and servers typically negotiate stronger protocols, making successful exploitation of this specific finding for a full breach highly unlikely in a generic context. **Affected domains (15)** `gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt218987188211145.gmail.com · alt7118113148928107 45.gmail.com · alt118.gmail.com`
10		`cipherlist_AVERAGE` Breach likelihood 1% ID vuln-10	A LOW severity cipher list misconfiguration, while a technical weakness, does not directly enable a breach. It typically requires an attacker to already be in a privileged position to exploit (e.g., man-in-the-middle). Without active exploitation or additional critical flaws, the direct likelihood of a breach is minimal. **Affected domains (15)** `gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com ·`

CYBERRANK

Finding details · continued

Rows 10–12 of 15

#	Severity	Finding	Rationale and affected domains
		cipherlist_AVERAGE (cont.)	alt912.gmail.com · alt8560.gmail.com · alt218987188821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
11		TLS_session_ticket Breach likelihood 1% ID vuln-11	TLS session ticket vulnerabilities (LOW severity) typically involve theoretical weaknesses like ticket predictability or lack of perfect forward secrecy. They require a man-in-the-middle position and specific conditions to exploit, are not commonly targeted, and do not directly lead to a breach without other significant flaws or attacker access. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt218987188821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
12		HSTS Breach likelihood 1% ID vuln-12	HSTS is a security enhancement, not a vulnerability. Its absence or misconfiguration (LOW severity) does not directly enable a breach. It only protects against specific, targeted SSL/TLS downgrade attacks, which are not common initial intrusion vectors. The likelihood of a breach stemming solely from this finding is negligible. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt218987188821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com

CYBERRANK

Finding details · continued

Rows 13–15 of 15

#	Severity	Finding	Rationale and affected domains
13		SWEET32 Breach likelihood 1% ID vuln-13	SWEET32 is a cryptographic vulnerability in legacy 64-bit block ciphers like 3DES and Blowfish. While a theoretical attack exists, it requires capturing massive amounts of encrypted data (hundreds of gigabytes) from a single session, which is an unrealistic scenario for most modern, generic applications. Modern systems and protocols have largely deprecated or mitigated these weak ciphers. The LOW severity reflects the impractical attack requirements and widespread mitigations, making direct breach from this flaw highly unlikely. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
14		BEAST Breach likelihood 1% ID vuln-14	BEAST is a legacy client-side attack against TLS 1.0 and early implementations of TLS 1.1. Modern browsers and servers have implemented effective mitigations for over a decade. The vulnerability requires a man-in-the-middle position and significant effort to exploit, and TLS 1.0/1.1 are widely deprecated and disabled. Therefore, the realistic likelihood of this directly leading to a breach is negligible. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com
15		LUCKY13 Breach likelihood 1% ID vuln-15	LUCKY13 is a low-severity cryptographic timing side-channel attack against TLS/SSL implementations. It requires a specific, controlled environment to exploit, is difficult to execute reliably over a network, and modern systems have mitigations. The direct breach likelihood from this finding alone is negligible. **Affected domains (15)** gmail.com / 142.250.207.5 · m.gmail.com · mta · multisend · alt10815.gmail.com · alt43.gmail.com · alt616.gmail.com · alt1.gmail.com · alt2.gmail.com · alt807.m.gmail.com · alt912.gmail.com · alt8560.gmail.com · alt21898718821145.gmail.com · alt711811314892810745.gmail.com · alt118.gmail.com

No additional subdomains or externally exposed assets were identified during this assessment.

Asset labels without a domain (mta, multisend) are shown as recorded in the source.

Vulnerability scan results

11 hosts scanned: 9 clean, 2 with findings reported.

Host	Result	Scanned	Findings
https://gmail.com	Clean	12 Oct 2026 18:29	0
https://220-mail.gmail.com	Clean	12 Oct 2026 18:29	0
https://akeravoicemail.gmail.com	Clean	12 Oct 2026 18:29	0
https://cdmvmail.gmail.com	Clean	12 Oct 2026 18:29	0
https://cfmfvmail.gmail.com	Clean	12 Oct 2026 18:29	0
https://imap.gmail.com	Scanned	12 Oct 2026 18:29	5 reported, 3 listed
https://m.gmail.com	Clean	12 Oct 2026 18:29	0
https://mars.gmail.com	Clean	12 Oct 2026 18:29	0
https://smtp.gmail.com	Scanned	12 Oct 2026 18:29	2
https://stats.imap.gmail.com	Clean	12 Oct 2026 18:29	0
https://voicemail.gmail.com	Clean	12 Oct 2026 18:29	0

Where the reported count differs from the findings listed, the source lists fewer findings than it counts; the difference is not explained by the source data.

CYBERRANK

Findings on https://imap.gmail.com

Executive Summary

The security scan identified only informational findings related to SMTP service detection and command enumeration on the host imap.gmail.com. No vulnerabilities of critical, high, medium, or low severity were discovered. These findings are typical of standard network reconnaissance and do not indicate any immediate security risk. The overall security posture appears strong, but continued monitoring and adherence to best practices are recommended.

#	Severity	Finding	Detail
1	Informational	**SMTP Service Detection on Port 25**	The scan detected an SMTP service listening on port 25. SMTP is used for email transmission and is a common service that may be targeted for spam relay or phishing if misconfigured. Impact: If the SMTP service is misconfigured, it could be abused for spam or phishing, potentially damaging the organization's reputation and leading to blacklisting. Remediation: 1. Ensure SMTP authentication is required for sending emails. 2. Implement TLS encryption for SMTP connections. 3. Restrict relay permissions to authorized networks only. 4. Regularly update and patch the SMTP server software.
2	Informational	**SMTP Service Detection on Port 587**	The scan detected an SMTP service listening on port 587, which is typically used for email submission with authentication. This is a standard configuration for secure email submission. Impact: No immediate impact, but if authentication is not enforced, it could be exploited for unauthorized email sending. Remediation: 1. Enforce authentication on port 587. 2. Require TLS encryption (STARTTLS). 3. Monitor for abuse and implement rate limiting.
3	Informational	**SMTP Commands Enumeration**	The scan enumerated SMTP commands using EHLO and HELP, revealing the extended commands supported by the server. This information can be used by attackers to understand the server's capabilities. Impact: Low risk, but detailed information about the SMTP server could aid in targeted attacks if not properly secured. Remediation: 1. Disable unnecessary SMTP commands. 2. Ensure the server is configured to not disclose sensitive information in banners. 3. Keep the SMTP server software up to date.

Top Recommendations

- Ensure SMTP services are properly secured with authentication and encryption (TLS) to prevent unauthorized access and data interception.
- Regularly review and restrict SMTP command capabilities to only those necessary for business operations.
- Monitor SMTP logs for unusual activity and consider rate limiting to mitigate abuse.

CYBERRANK

Findings on https://smtp.gmail.com

Executive Summary

The security scan identified two informational findings related to SMTP service detection on smtp.gmail.com (ports 25 and 587). No actual vulnerabilities were discovered. These findings simply confirm the presence of standard email service ports, which is expected for a mail server. The overall security posture is not negatively impacted by these results.

#	Severity	Finding	Detail
1	Informational	**SMTP Service Detection on Port 25**	The scan detected an SMTP service listening on port 25 of smtp.gmail.com. SMTP (Simple Mail Transfer Protocol) is used for sending and relaying email. This is an informational finding indicating the presence of a mail server, not a vulnerability. Impact: No direct business impact. This is expected behavior for an email service provider. However, unauthenticated or unencrypted SMTP could be abused for spam if misconfigured, but this is a standard service. Remediation: 1. Verify that SMTP on port 25 is configured to require authentication for relaying. 2. Ensure TLS encryption is enforced for email transmission. 3. Monitor for abuse and apply rate limiting as needed. 4. No action is required if this is an intentional public mail service.
2	Informational	**SMTP Service Detection on Port 587**	The scan detected an SMTP service listening on port 587 of smtp.gmail.com. Port 587 is typically used for email submission with authentication and encryption (STARTTLS). This is an informational finding, not a vulnerability. Impact: No direct business impact. This is a standard and recommended port for email submission. It indicates the service supports secure email sending. Remediation: 1. Confirm that port 587 enforces STARTTLS and authentication. 2. Ensure strong authentication mechanisms are in place. 3. Regularly update and patch the mail server software. 4. No action is required if this is an intentional public mail service.

Top Recommendations

- No immediate action required; these are informational findings only.
- Ensure SMTP services are properly secured with authentication and encryption (e.g., TLS) if not already in place.
- Regularly review exposed services to confirm they are intentionally public and necessary.

CYBERRANK

Email and DNS security controls

Control	Result	What it does and what was recorded
DKIM	✕ Not enabled	Signs outgoing mail so receivers can verify its origin and integrity. Key strength: Not available (not provided in the assessment data) Source: "DKIM: Not Enabled – supports email integrity and sender authenticity."
DMARC	✓ Enabled	Sets how receivers treat mail failing SPF or DKIM; reports spoofing. Policy mode (p=): Not available (left blank in the assessment data) Verify the published DMARC policy (p=) before acting on priority action 15. Source: "DMARC: Enabled (mode) – visibility into spoofing attempts is present."
DNSSEC	✕ Missing or invalid	Authenticates DNS responses and protects against DNS cache poisoning. Source: "DNSSEC: Missing / Invalid – authenticates DNS responses and protects against DNS cache poisoning."
SPF	⊖ Not reported	Lists the servers allowed to send mail for the domain. No result for this control in the assessment data; not a pass.

It is recommended to progressively enforce DMARC policies to reduce phishing and impersonation risks. DKIM RSA keys must be at least 2048 bits; 1024-bit keys are flagged as a LOW finding. DNSSEC should be enabled (DS record + RRSIG + valid chain of trust) to prevent DNS spoofing.

CYBERRANK

IP reputation

Result held for review

The source printed "-1" for the abuse score and labelled this check "IP Reputation — Clean". What -1 means is not confirmed, so the result is held for review, not read as clean.

What was checked

Checked 2 IP(s) against threat intelligence feeds.

IP address	ISP	Country	Abuse score	Reports
142.251.42.101	Not available *	Not available *	Not available †	0 ‡
2404:6800:4006:807:0:0:0:2005	Not available *	Not available *	Not available †	0 ‡

* Left blank in the assessment data.
† Value meaning not confirmed; withheld pending review. The source printed "-1".
‡ Recorded value; its meaning is not confirmed, so it is held for review.

Other checks

Check	Result	Note
HTTPS redirect	✓ No findings	HTTP correctly redirects to HTTPS. No insecure patterns detected. Source: "HTTPS Redirect — Secure". What was checked: Not available (not provided in the assessment data).

Related priority actions

#	Priority	Action	Required role	Time (reported)
15		Enhance DMARC Policy to "Quarantine"	Email admin	1 week

Owners, due dates and status are listed with each action in section 02.

05 · ASSESSMENT DETAILS

Credential exposure

Identifies credential leaks associated with the organization's domains found in known data breaches. Exposed credentials represent a direct risk of unauthorized account access.

Findings

The source reports 15,879 (unit not defined by the source) and lists 5,395 register rows spanning 2008 to 2026, 3,687 of which list a password category (3,685 under the field key "password", 2 only under the breach label "Passwords"). The number of unique or active accounts is not known.

3,154 rows
rows on gmail.com or its subdomains listing a password category (182 dated 2025–2026; 327 with latest year 2008–2024; 2,645 with period "Unknown" only)

3,687 rows
rows where the source lists a password field (category only; no password values appear in this report or its data files)

3,254 rows
rows recording a service/URL (origin); value not provided by source

15,879
reported by source (unit not defined by source); 5,395 register rows listed

2026
latest exposure year in source

Not available
unique accounts
Cannot be derived from the available data.

Source headline: 15,879 (unit not defined by the source); listed: 5,395 register rows; difference -10,484 — not explained by the source data.

Computed over 5,395 rows; source total not provided — counts are lower bounds.

Credential score printed by the source: 40%. It is a source value, identical across the reports reviewed, and is not used as a result here.

Payload count (prepared from the source rows; not printed by the source) "Rows with the field key 'password'" is 3,685; the register rows give 3,687 (difference +2). It counts the field key 'password' only; 2 rows list a password only under the breach label 'Passwords' (RF-G07).

Email domain of exposed accounts

Listed rows: 5,395 of 15,879 reported. Each row counts once, by the domain of its email address and by the field categories the source lists.

Account email domain	Password category listed	No password category	Fields not reported	Total
gmail.com (assessed domain)	**2,907**	22	1,167	4,096
Subdomains of gmail.com	247	213	251	711
Other email domains (counted, not named)	532	0	55	587
Unknown Email (source label)	1	0	0	1
All listed rows	**3,687**	**235**	**1,473**	**5,395**

The email domain shows the account's mailbox provider, not the service or subdomain where the credential was obtained.

Rows by latest exposure year

Exclusive: the buckets sum to the 5,395 listed rows.

Latest exposure year	Rows
2026	70
2025	211
2024	188
2023	9
2022	78
2021	30
2020	963
2019	139
2018	77
2017	26
2016	110
2015	33
2014	5
2013	12
2012	14
2011	7
2008	19
Period “Unknown” in source (63%)	3,404

Each row counts once, under the latest year the source gives for it. Rows whose period the source prints only as “Unknown” are a separate bucket, not counted as earlier.

251 rows list both a year and “Unknown”; counted under the latest year.

Exposure years as listed by the source: “2008-2009-2010-2011-2012-2013-2014-2015-2016-2017-2018-2019-2020-2021-2022-2023-2024-2025-2026”.

Row status as recorded: Open 5,395. Status is the source's per-row flag; it is not a confirmation that a password was reset.

Row-level detail: Appendix D.2.4 lists all 5,395 register rows (account as delivered, masked; approximate exposure period; exposed fields).

Full register D.2 Credential exposure — supporting tables · 5,395 rows · Appendix D, pages 48–215

Recommended mitigation measures

Attention: Historical credential exposures were identified. Password resets and MFA enforcement are recommended.

- Force password resets for all affected accounts
- Enable multi-factor authentication across all user access points
- Review password hygiene and access policies
- Monitor authentication logs for anomalous activity
- 3,254 rows record a service/URL (origin) with the credential, a pattern typical of infostealer logs: revoke active sessions and tokens for the affected accounts and notify the affected users.
- Rows on other email domains are not accounts the organisation manages; tell the affected users rather than resetting them centrally.

CYBERRANK

06 · ASSESSMENT DETAILS

Data breach and leak history

Documents publicly known data leak incidents. Historical data leaks are factored into the IISRI® score, with recency and severity both affecting the overall rating.

Pending review

17 breach records naming gmail.com were listed: one as the last valid breach (marked reported inaccurate) and 16 as historical records not directly used in scoring. Several describe credential compilations rather than a compromise of the organisation.

Result held for review

The breach named as the last valid breach and "used in the rating calculation" is also marked "(Reported Inaccurate)". Which event, if any, is scored is held for review.

07 · ASSESSMENT DETAILS

Data sovereignty

Where this supplier says disputes and legal obligations are handled

Findings	Governing law could not be identified.

Governing law / courts found	Not identified in published policies
Accepted jurisdictions	European Union (EU)
Against the preference	Cannot be compared
Source verdict	“does not match the jurisdictions your organisation accepts (European Union (EU))”

No governing-law or court clause could be matched in the published policies, so legal location cannot be compared with the preference set by the report owner/requestor (European Union (EU)). Treat it as unresolved until confirmed.

Source text: “We could not identify a governing-law or court clause in the supplier's published policies, and that does not match the jurisdictions your organisation accepts (European Union (EU)). Until that is clear, treat legal location as unresolved.” Review note: the source prints a verdict, but no governing-law clause was identified, so this report reads the comparison as “Cannot be compared” until the clause is confirmed.

CYBERRANK

Scope breakdown

High 30 Moderate 0 Low 104

14 subdomains in 2 groups with identical counts, PQC status and algorithms, ordered by High, then Moderate, then Low findings. Appendix D.4 lists one row per subdomain and every scope × algorithm row (134).

Subdomains				PQC	Algorithms vs apex
13 subdomains	2	0	7	ML-KEM detected	Same as apex
alt807.m.gmail.com	2	0	6	ML-KEM detected	No ECDSA

Apex aggregate (the headline scope, not added to subdomain rows): High 30 · Moderate 0 · Low 104.

Full register D.4 Quantum scope breakdown · 15 rows · Appendix D, pages 215–222

Scope and limitations

We cannot guarantee that a domain or organization is fully quantum-safe based on the results of this assessment because:

- Post-quantum cryptography is an evolving field. Cryptographic standards, implementations, and the understanding of quantum computing capabilities continue to develop. Future advances may affect the security of algorithms considered secure today.
- This is a non-invasive, external assessment. Unless an internal CyberRank agent is deployed, the scan evaluates only externally observable services and configurations. Internal systems, private networks, and services that are not externally accessible are outside the scope of this assessment.

Post-quantum readiness

A domain can only be considered fully post-quantum ready if it:

- Supports post-quantum cryptographic (PQC) algorithms for secure connections; and
- Disables legacy TLS versions (TLS 1.0, TLS 1.1, and TLS 1.2).

Allowing legacy TLS versions enables clients to establish connections using classical cryptographic algorithms. If an attacker can force or negotiate the use of an older protocol version (a protocol downgrade), the connection may lose the protections provided by post-quantum cryptography.

CYBERRANK

14 · ASSESSMENT DETAILS

Fourth-party vendors

Identifies fourth-party vendors — the suppliers and service providers used by this vendor — representing extended supply chain risk. Each vendor is assessed for security posture and compliance.

○ None identified	No connected organisations reported for Gmail.

No connected organisations identified

None were found with the methods used. This does not show that Gmail has no suppliers.

What was checked

This assessment is based on automated technology discovery and vendor relationship analysis.

Supply-chain aggregation How fourth-party ratings feed combined supply-chain risk · Appendix C, page 45

CYBERRANK

15 · ASSESSMENT DETAILS

Cloud infrastructure

Identifies cloud service providers used by the organization through analysis of DNS records, IP ranges, MX records, and NS records. Cloud infrastructure detection reveals the hosting and service provider footprint of the assessed organization.

Findings	One cloud provider, GCP, was detected. Detection shows provider use, not where all customer data is stored.

About this report

This report is generated by IISRI® CyberRank.ai using automated, non-intrusive analysis of publicly accessible information. The assessment does not require access to internal systems and should be interpreted as an external risk signal.

Data sources

- Automated analysis of data leak databases, public disclosures, and monitored online sources.
- Automated technology discovery and vendor relationship analysis.
- Analysis of DNS records, IP ranges, MX records, and NS records.

Reading the result states

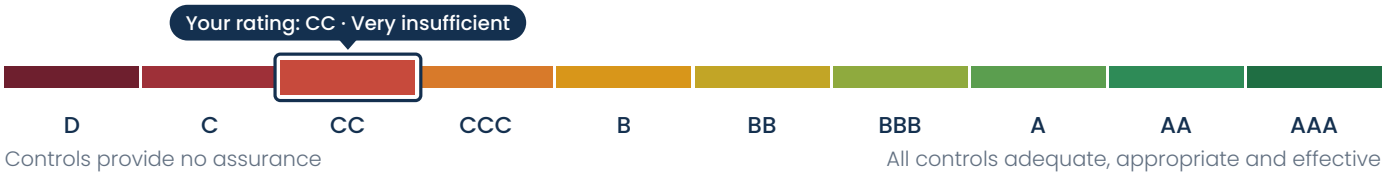

Every section carries one of these states next to its verdict.

State	Meaning
Findings	Assessed; issues or items were reported. In inventory sections (certifications, fourth-party vendors, cloud) this means items were observed, not that they are a risk.
No findings	Assessed; nothing was found within the sources and period checked. It does not mean the organisation is safe.
Not assessed	The module was not run for this report. No result is implied.
Not applicable	The check does not apply to this organisation.
Unavailable	The value could not be obtained or used. The reason is printed with it.
Partial coverage	Only part of the scope was covered; the results cover the part shown.
Pending review	A value exists but its meaning is unclear or contradicted; held for review.

B · APPENDICES AND REFERENCES

IISRI rating scale

Reference guide to the standardized rating scale used throughout this report, with descriptions of each grade level and associated risk profile.

Grade	Meaning
AAA Excellent	All information security and/or privacy controls are adequate, appropriate, and effective enough to provide reasonable assurance that security and/or privacy issues are being managed, and objectives are met.
AA Very good	Almost all information security and/or privacy controls are adequate, appropriate, and effective enough to provide reasonable assurance that security and/or privacy issues are being managed, and objectives are met.
A Good	Almost all information security and/or privacy controls are adequate, appropriate, and effective enough to provide reasonable assurance that security and/or privacy issues are being managed, and objectives are met. A few specific control weaknesses have been noted. Minor additional work on information security and/or privacy is recommended.
BBB Satisfactory	Main information security and/or privacy controls are adequate, appropriate, and effective enough to provide reasonable assurance that security and/or privacy issues are being managed, and objectives are met. A few specific control weaknesses have been noted. Minor additional work on information security and/or privacy is recommended.
BB Sufficient	Main information security and/or privacy controls are adequate, appropriate, and effective enough to provide reasonable assurance that security and/or privacy issues are being managed, and objectives are met. Some specific control weaknesses have been noted. Major additional work on information security and/or privacy is recommended.
B Moderate	Some information security and/or privacy controls are adequate, appropriate, and effective enough to provide reasonable assurance that security and/or privacy issues are being managed, and objectives are met. Many specific control weaknesses have been noted. Major additional work on information security and/or privacy is highly recommended.
CCC Insufficient	Main information security and/or privacy controls are unlikely to provide reasonable assurance that security and/or privacy issues are being managed and objectives are met. Major work on information security and/or privacy is highly recommended.
CC Very insufficient **Your rating**	Almost all information security and/or privacy controls are unlikely to provide reasonable assurance that security and/or privacy issues are being managed and objectives are met. Major work on information security and/or privacy is highly recommended.
C Poor	Almost all information security and/or privacy controls are unlikely to provide reasonable assurance that security and/or privacy issues are being managed and objectives are met. Major work or completely new program on information security and/or privacy is required.
D Very poor	All information security and/or privacy controls are not providing any assurance that security and/or privacy issues are being managed and objectives are met. Complete new program on information security and/or privacy is required.

CYBERRANK

C · APPENDICES AND REFERENCES

Methodology and supply-chain aggregation

One rating for every vendor. One risk number for your whole supply chain.

CYBERRANK turns externally observable evidence about an organisation into a single severity rating, a normalised risk score, and a combined risk that includes the vendors — and the vendors' vendors — behind it.

The problem

Attackers reach organisations through their suppliers. Existing tools don't add up: CVSS scores single technical flaws, questionnaires rely on self-reporting, and privacy, AI and quantum exposures have no common scale at all.

The approach

An ISO 31000-aligned model with four explicit steps, from observed weaknesses to supply-chain risk. Every step is reproducible and every number is comparable across organisations and portfolios.

The regulatory fit

Built for the obligations in DORA, NIS2, the GDPR and the AI Act, and aligned with ISO/IEC 27001, 27701 and 42001, NIST SP 800-53 and 800-161, PCI DSS and the NIST CSF.

How a rating becomes a risk four steps, one pipeline

1

Observe

Continuous external signals are collected without touching the organisation's systems.

Vulnerabilities · Privacy compliance · Credential & data leaks · Data sovereignty · Data residency · Terms of use · AI · Quantum

Certified controls earn credits: ISO 27001, ISO 27701, SOC 2, ISAE 3402, PCI DSS. Optional questionnaires add a second, bounded evidence channel.

2

Rate

Every organisation starts with a full point budget, split evenly between a security bucket and a privacy bucket. Weaknesses deduct capped demerits; certifications add capped credits.

The net score maps to the IISRI rating, AAA to D. The rating reflects the organisation's own posture only — a vendor's weakness never changes it.

3

Score the risk

Likelihood = threat probability × weakness. Threat probability comes from sector, size and internet exposure; weakness comes from the rating. Impact is one of four tiers you assign: Critical, High, Medium or Low.

Risk = normalised likelihood × impact, reported as a score and a band: Low, Medium, High or Critical.

4

Combine

Vendors and sub-vendors are discovered automatically and rated with the same pipeline. Their risks are folded into yours, attenuated by distance in the chain.

The combined risk shows the cascading exposure that your own rating cannot see.

The IISRI rating scale Ten grades. Higher grades mean lower weakness values and therefore lower likelihood.

D	C	CC	CCC	B	BB	BBB	A	AA	AAA
Very poor	Poor	Very insufficient	Insufficient	Moderate	Sufficient	Satisfactory	Good	Very good	Excellent

Controls provide no assurance — All controls adequate, appropriate and effective

General methodology, the same in every report; figures on the supply-chain page are illustrative and are not results for Gmail. Copyright © 2026 IISRI. All rights reserved. Full methodology paper: "An Integrated Quantitative Methodology for Third-Party Security, Privacy and AI Risk Rating", July 2026. Available upon request.

Your rating describes you. Your combined risk describes your supply chain.

Every vendor and sub-vendor is rated with the same pipeline as you are. A weak vendor never lowers your own rating — that stays attributable to your posture. But an exploited vendor can open an attack path into your systems, so the same weakness does enter your combined risk, attenuated by how far away it sits in the chain.

The result is two complementary numbers. Read together, they show that an excellent rating does not certify a healthy supply chain.

Individual risk

Low

Your own posture, as if you had no suppliers. Suitable for external presentation.

Combined risk

Medium

You plus every vendor and sub-vendor. The number to manage against.

Combined risk — the "at least one adverse event" composition, applied recursively through the chain

$$R(N) = 1 - (1 - o_N) \cdot \Pi_{s \in \text{suppliers}(N)} \left(1 - R(s) \,/\, (f + d(s))^2 \right)$$

Every supplier's effective risk R(s) already contains its own suppliers, so the chain unrolls from the outermost leaves inward. Each factor is one party's chance of *not* causing an incident; one minus the product is the chance that something, somewhere in the chain, goes wrong.

o_N — A node's own individual risk score — from its rating, threat probability and impact tier.

$d(s)$ — Hops from the centre: d(s) = d(N) + 1. Each supplier sits one step further out and is damped more.

$R(A)$ — Your combined risk: the formula evaluated at your own organisation A, the centre of the graph (d = 0).

$R(s)$ — A supplier's effective risk, computed the same way from its own suppliers. A leaf with no suppliers has R = o_N.

f — The transmission fraction you configure. A larger f trusts distance more and shrinks every supplier's contribution.

Impact tiers you assign to each vendor

Critical	Failure immediately stops a critical service or causes a serious regulatory breach. DORA: critical.
High	Essential, but a temporary loss can be bridged with workarounds. DORA: important.
Medium	Supports normal operations; disruption means inconvenience. The default tier at onboarding.
Low	Minimal or no operational impact.

Why you can rely on it

- **Standards-grounded** — ISO 31000, ISO/IEC 27001, 27701 and 42001, NIST SP 800-30 and 800-53, DORA and NIS2.
- **Certified operator** — an independently audited ISO/IEC 27001 management system; ISO/IEC 42001 certification in progress.
- **Human in the loop** — users report inaccuracies and appeal findings; feedback tunes detection confidence over time.
- **Honest about limits** — vendor compromises are treated as independent, some detections are heuristic, and the continuous score is primary over the qualitative heat map.

An organisation's own excellent rating does not certify its supply chain. Only the combined risk does.

The dashboard shows, for you and every (sub-)vendor, six domains — Security, Privacy, Data leaks, Controls, AI, Quantum — plus the IISRI rating, the individual risk and the combined risk.

A row can count in several categories; column total exceeds row total.

CYBERRANK

D.2.2 Rows by data class

Exclusive: each row counts once, in its highest class (password, then sensitive personal data, then other identity fields). The origin flag is counted apart, below.

Data class	Rows
Password category listed	3,687
Sensitive personal data, no password	102
Other identity fields only	133
Fields not reported by source	1,473

Service/URL recorded (origin), counted apart from the classes: 3,254 rows; the value itself is not provided by the source.

D.2.3 Exposure episodes and sources

Data unavailable: episode grouping and breach source names are not provided in the assessment data. This is not a zero result.

D.2.4 Credential register

One row per register row as delivered by the Cyberrank system. The account label is printed exactly as received (masking is applied upstream, not by this report). Sorted by the newest period a row lists; rows whose period is only "Unknown" come last. Exposed fields are category names only; no password or other value is printed.

Status: Open (all rows).

End of register · 5,395 rows. 5,395 of 5,395 register rows shown; 0 not shown (none withheld). Totals: gmail.com 4,096 + subdomains of gmail.com 711 + other email domains 587 + Unknown Email 1 = 5,395 rows = Section 05 overview total; source headline 15,879 (unit not defined by the source; difference -10,484, not explained by the source data).

D.4 Quantum scope breakdown

High 30 Moderate 0 Low 104

D.4.1 lists one row per scope with its post-quantum (PQC) status, ordered by High, then Moderate, then Low findings. The apex aggregate (the source headline scope) comes first; subdomain rows are not added to it. Showing 15 of 15 scopes. D.4.2 lists every scope × algorithm row (134 of 134).

Unit: scopes (D.4.1) and scope × algorithm rows (D.4.2); counts are findings. Source: per row. State: Findings. Snapshot 15 Oct 2026.

Back to Section 11 Quantum security, p. 34

Post-QC “Not listed”: the source prints a dash, so no post-quantum replacement is listed for that algorithm; the source does not say whether one was checked.
